Composition comprises an oil thickened with a semisolid fatty material and a polymer (I), having a molecular weight below 100,000, a backbone of repeating heteroatom-containing hydrocarbon units and pendant and/or terminal aliphatic chains (optionally functionalized) having 8-120 carbon atoms and making up 40-98% of the total number of heteroatom-containing units and aliphatic chains.

Abstract not available for EP1343459

Abstract of corresponding document: **WO0247631**

The invention concerns a composition containing, in a physiologically acceptable medium: (a) at least a DHEA derivative selected among 7-hydroxy DHEA and 7-keto DHEA, and (b) at least an isoflavonoid. The invention also concerns cosmetic and dermatological uses of said composition, in particular for preventing or treating actinic skin ageing symptoms.
